SAFETY CHECK-OUT

(US Model only)

After correcting the original service problem, perform the following safety checks before releasing the set to the customer:

1. Check the area of your repair for unsoldered or poorly-soldered connections. Check the entire board surface for solder splashes and bridges.
2. Check the interboard wiring to ensure that no wires are "pinched" or contact high-wattage resistors.
3. Check that all control knobs, shields, covers, ground straps, and mounting hardware have been replaced. Be absolutely certain that you have replaced all the insulators.
4. Look for unauthorized replacement parts, particularly transistors, that were installed during a previous repair. Point them out to the customer and recommend their replacement.
5. Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
6. Check the line cord for cracks and abrasion. Recommend the replacement of any such line cord to the customer.
7. Check the condition of the monopole antenna (if any). Make sure the end is not broken off, and has the plastic cap on it. Point out the danger of impalement on a broken antenna to the customer, and recommend the antenna's replacement.
8. Check the B+ and HV to see they are at the values specified. Make sure your instruments are accurate; be suspicious of your HV meter if sets always have low HV.
9. Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

LEAKAGE

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microamperes). Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2V AC range are suitable. (See Fig. A)

HOW TO FIND A GOOD EARTH GROUND

A cold-water pipe is guaranteed earth ground; the cover-plate retaining screw on most AC outlet boxes is also at earth ground. If the retaining screw is to be used as your earth-ground, verify that it is at ground by measuring the resistance between it and a cold-water pipe with an ohmmeter. The reading should be zero ohms. If a cold-water pipe is not accessible, connect a 60-100 watts trouble light (not a neon lamp) between the hot side of the receptacle and the retaining screw. Try both slots, if necessary, to locate the hot side of the line; the lamp should light at normal brilliance if the screw is at ground potential. (See Fig. B)

"CAUTION"

TO AVOID AN ELECTRIC SHOCK FROM CHARGED HIGH VOLTAGE OF PICTURE TUBE.

• REMOVAL OF ANODE-CAP

Short circuit the anode of the picture tube and the anode cap to the metal chassis, picture tube shield or carbon painted on the picture tube, after removing the anode.

• REMOVING PROCEDURES

• HOW TO HANDLE AN ANODE-CAP

- ① Don't hurt the surface of anode-caps with sharp shaped material!
- ② Don't press the rubber hardly not to hurt inside of anode-caps!
A material fitting called as shatter-hook terminal is built in the rubber.
- ③ Don't turn the foot of rubber over hardly!
The shatter-hook terminal will stick out or hurt the rubber.

The diagram illustrates the receiver section of the Model 10000, featuring a complex interconnection of functional blocks. Key components include:

- Input and Initial Processing:** The signal enters through a **1 S BUS 1/F** block, which connects to a **PB** (Pilot Beat) block. This is followed by a **VCO** (Variable Frequency Oscillator) and a **FF** (Frequency Filter) block, leading to a **PILOT DET** (Pilot Detector).
- Signal Path and Filtering:** The signal path continues through a **1st LPF** (Low Pass Filter) and a **2nd LPF** (Low Pass Filter). A **1st LPF** and **2nd LPF** are also shown in parallel with the main path, leading to an **ATT** (Attenuator) block.
- Control and Detection:** A **SIN TRAP 1** (Signal Interference Nulling) block is connected to the main signal path. A **SIN TRAP 2** block is also present. A **SAP BPF** (Signal Analysis Pass Band Filter) and **SAP OSC** (Signal Analysis Oscillator) block are connected to the signal path. A **NOISE DET** (Noise Detector) block is connected to the signal path.
- Power and Frequency Control:** A **POW** (Power) block is connected to the signal path. A **11.5th BPF** (Band Pass Filter) and a **NOISE DET** block are also shown.
- Output and Control:** The signal path leads to a **WIDE VCA** (Wideband Variable Gain Amplifier) block, which is connected to a **WIDE BPF** (Wideband Band Pass Filter) and a **WIDE RHS** (Wideband Right Hand Side) block. The signal then passes through a **SW** (Switch) block, which is connected to a **SURR** (Surround) block and a **BASS TREBLE** (Bass/Treble) control block. A **VOL** (Volume) control block is also shown.
- Bus System:** The entire system is connected to a common bus system, with various blocks having dedicated lines to the bus. The bus lines are labeled with numbers 1 through 32.
